DETAILED ACTION

Response to Amendment

This action is in response to the amendment mailed September 28, 2005.
 Claims 1 and 3-6 were amended and claims 2 and 7-8 were cancelled rendering claims 1 and 3-6 pending.

Claim Rejections - 35 USC § 103(a)

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1 and 3-6, are rejected under 35 U.S.C. 103(a) as being unpatentable over Kitamura et al. (U.S. 6,465,086).

Kitamura teaches an ink jet recording material having two coatings, where the inner coat comprises silica (column 2, lines 23-31 and column 8,lines 19-30) and where the first and second coatings are formed on the surface (column 3, lines 17-65, column 6, lines 10-42 and column 7, lines 49-60). Kitamura discloses the coating layer can be formed by conventional coating means, including a gravure means (column 12, lines 22-26 and column 22, lines 20-22) where the support is a paper sheet (column 13, lines 41-50). Kitamura discloses the inner coat (underrecording layer) comprises silica and the

surface coat (upperrecording layer) comprising kaolin or calcium carbonate (column 8, lines 21-30). Kitamura further discloses the invention being of conventional coated paper sheets (column 8, lines 5-18 and column 20, line 22) where paper sheets conventionally comprise fibrous materials. The reference discloses drying the coated paper (column 13, lines 20-33 and column 25, lines 20-27) and calendering the material (column 25, lines 28-32). Kitamura does not explicitly disclose that the cited inner coat has the deposition amount as instantly claimed. Such deposition amount is a property which can be easily determined by one of ordinary skill in the art. With regard to the limitation of the deposition amount, absent a showing of unexpected results, it is obvious to modify the conditions of a composition because they are merely the result of routine experimentation. The experimental modification of prior art in order to optimize operation conditions (e.g. deposition amount) fails to render claims patentable in the absence of unexpected results. The aforementioned limitation is optimizable as it directly affects the mechanical strength and durability of the coated paper. As such, it is optimizable. It would have been obvious to one of ordinary skill in the art to make the coated paper with the limitations of the deposition amount of the inner coat since it has been held that discovering an optimum value of a result effective variable involves only routine skill in the art. In re Boesch, 617 USPQ 215 (CCPA 1980). In claims 1 and 4. Applicant amends the claims to include "which conventional surface coat includes a pigment component consisting essentially of kaolin and/or calcium carbonate." For the purposes of searching for and applying prior art under 35 U.S.C. 102 and 103, absent a clear indication in the specification or claims of what the basic and novel characteristics

Art Unit: 1774

actually are, "consisting essentially of" will be construed as equivalent to "comprising." See, e.g., PPG, 156 F.3d at 1355, 48 USPQ2d at 1355. If an applicant contends that additional steps or materials in the prior art are excluded by the recitation of "consisting essentially of," applicant has the burden of showing that the introduction of additional steps or components would materially change the characteristics of applicant's invention. In re De Lajarte, 337 F.2d 870, 143 USPQ 256.

Response to Arguments

4. The rejection made under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s) is withdrawn due to Applicant amending claim 3 to further limit claim 1 to "from one gram to three grams per square meter (1 to 3 g/m2)."

Rejection made under 35 U.S.C. 103(a) as being unpatentable over Werkema et al. (U.S. 4,575,477) is withdrawn due to Applicant removing precipitated calcium carbonate from claims 1 and 4.

Applicant's arguments regarding rejection made under 35 U.S.C. 103(a) as being unpatentable over Kitamura et al. (U.S. 6,465,086) have been considered but are unpersuasive. Applicant argues the composition of the inner coat includes a single pigment of silica and the conventional surface coat consists essentially of kaolin and/or calcium carbonate as a pigment, which excludes silica as a pigment in such a coat.

Application/Control Number: 09/508,316

Art Unit: 1774

256.

Kitamura discloses the inner coat (underrecording layer) comprises silica and the surface coat (upperrecording layer) comprising kaolin or calcium carbonate (column 8, lines 21-30). In claims 1 and 4, Applicant amends the claims to include "which conventional surface coat includes a pigment component consisting essentially of kaolin and/or calcium carbonate." For the purposes of searching for and applying prior art under 35 U.S.C. 102 and 103, absent a clear indication in the specification or claims of what the basic and novel characteristics actually are, "consisting essentially of" will be construed as equivalent to "comprising." See, e.g., PPG, 156 F.3d at 1355, 48 USPQ2d at 1355. If an applicant contends that additional steps or materials in the prior art are excluded by the recitation of "consisting essentially of," applicant has the burden of showing that the introduction of additional steps or components would materially change the characteristics of applicant's invention. In re De Lajarte, 337 F.2d 870, 143 USPQ
